Collaborative Filtering with Matrix Factorization

[Start of transcript. Skip to the end.](#)

So the problem with the approach that we discussed previously is that there is no connection between assignment of values for all the different and the entries of x . Whatever selection you are given for the first user for movie number 20 and 25 have no

Matrix Factorization Practice

1/1 point (graded)

We now use **collaborative filtering** to solve the movie recommender system problem.

As we saw in the previous problem, we ended up with an unsatisfactory and trivial solution of X by minimizing the objective alone:

$$J(X) = \sum_{a,i \in D} \frac{(Y_{ai} - X_{ai})^2}{2} + \frac{\lambda}{2} \sum_{(a,i)} X_{ai}^2.$$

In the collaborative filtering approach, we impose an additional constraint on X :

$$X = UV^T$$

for some $n \times d$ matrix U and $d \times m$ matrix V^T . The number d is the **rank** of the matrix X .

Suppose

$$X = \begin{bmatrix} 3 & 6 & 3 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix},$$

then what is the minimum possible d ?

$d =$ ✓ Answer: 1

Solution:

X can be decomposed as

$$X = \begin{bmatrix} 3 \\ 2 \\ 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 1 \end{bmatrix}$$

Remark: Note that imposing that a n by m matrix X has rank $k < \min(m, n)$ means that some of its rows (*resp.* columns) are linearly dependent on other rows (*resp.* columns).

Intuition on the Vector Factors

1/1 point (graded)

Assume we have a 3 by 2 matrix X i.e. we have 3 users and 2 movies. Also, X is given by

$$X = \begin{bmatrix} \text{User 1's rating on movie 1} & \text{User 1's rating on movie 2} \\ \text{User 2's rating on movie 1} & \text{User 2's rating on movie 2} \\ \text{User 3's rating on movie 1} & \text{User 3's rating on movie 2} \end{bmatrix} = UV^T$$

for some $3 \times d$ matrix U and $d \times 2$ matrix V^T .

Now which of the following is true about U and V^T ? (Choose all those apply.)

☒ The first row of U represents information on user 1's rating tendency

☐ The first row of U represents information on movie 1

☐ The first column of V^T represents information on user 1's rating tendency

☒ The first column of V^T represents information on movie 1

**Solution:**

U encodes information about the users, and V about the movies.
